Antibodies to Plasmodium vivax blood stage antigens - used to diagnose malaria and to determine whether P. vivax is the species responsible for infection
Example 4; Column 19-24; 22pp; English.

The present sequence is that of a species-specific plasmodium vivax malarial antigen. PPESP-1. The gene (T34620) appears to be missing a small portion of its 5' end. This protein is secreted into the plasma of a susceptible mammalian host after infection. Monoclonal/polyclonal antibodies can be utilised in assays used to diagnose malaria, as well as to determine whether P. vivax is the species responsible for the

Immune inducing polypeptide against Leucocytozoan protozoa - useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; Page 12-14; 20pp; Japanese.
R70491-93 are polypeptides having a whole or partial epitope of a
structural protein of Leucocytozoan protozoa encoded by 087587-89.
The polypeptides and DNA encoding them are useful in the production
of vaccines for the treatment of leucocytozoanosis of fowl.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

C (GPR) Proteins selected from CAMP, adenosine, muscarinic acceptor (GPR) proteins selected from CAMP, adenosine, muscarinic acceptorline, adrenergic, thrombin, endothelin, bombesin, endocrine, rhodopsin, opsin, odorant, cytomegaloviral and other GPR proteins. The peptides

C W035758 W03651 represent the N-terminal fragments of the above proteins.

The receptor proteins were used to design polypeptides, pref. based on the transmembrane domains, for use in G-protein coupled receptor 11gand binding assays. The polypeptide fragments retain biological activity such as binding a GPR ligand or modulating GPR ligand binding to a GPR (see W02747-W02999 for examples of polypeptide fragments).

The polypeptide fragments can be used in compositions for treating suppliering from a pathology related to a GPR abnormality e.g. a psychotic disorder such as schizophrenia.
17-DEC-1996 (first entry)

Human thyrotropin GPR N-terminal sequence.

G-protein coupled receptor; ligand binding assay; transmembrane domain;

Schizophrenia; dopamine; cAMP; adenosine; thrombin; adrenergic; opsin;

muscarinic acetylcholine; endothelin; bombesin; endocrine; rhodopsin;
odorant; cytomegalovirus; serotonergic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       64 EEAEPHTEPEEQVPVEAEPQNIEDEAKEQIQSLLHEMVHAEHVEGEDLQQEDGPTGEPQQ 123

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             falciparum
Discloaure: Fig 1; 55pp: English.
Discloaure: Fig 1; 55pp: English.
The inventors claim a novel DNA molecule which comprises a nucleotide sequence corresp. to all or a portion of the base sequence coding RESA (N60472) or FIRA (N60473). RESA and FIRA have antigenicity suitable for providing protective immunity against Plasmodium falciparum malarial infections.
                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         protein or a fragment of it can be used in a recombinant vaccine to immunise against chicken leucocytozoan disease. DNA encoding the protein is used in a vector and operatively linked to an expression regulatory sequence as in standard practice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Chicken leucocytozoan immunogenic protein - used in a recombinant vaccine against chicken leucocytozoan disease Claim 6; Page 6-9; 35pp; Japanese. R97866 is a chicken leucocytozoan-derived immunogenic protein. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

R70491-93 are polypeptides having a whole or partial epitope of a structural protein of Leucocytozoan protozoa (encoded by 087587-89). The polypeptides and DNA encoding them are useful in the production of vaccines for the treatment of leucocytozoanosis of fowl.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   - useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                               Leucocytozoan protozoa structural protein epitope.
leucocytozoan protozoa; structural protein; epitope; vaccine; fowl;
leucocytozoanosis; treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New dopamine receptor peptide - useful as antipsychotic agent, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       144 EVSHEETEHSYHVEETVSQDCNQDMEEM-MSEQENPDSSEPVVEDERLHHDTDDVTYQVY

Proteins W02657-W02720 represent a range of G-protein coupled receptor dGPR) proteins selected from cAMP, adenosine, muscarinic acetylcholine, adrenergic, thrombin, endothelin, bombesin, endocrine, rhodopsin, opsin, odorant, cytomegaloviral and other GPR proteins. The peptides W03578-W03651 represent the N-terminal fragments of the above proteins. The receptor proteins were used to design polypeptides, pref. based on the transmembrane domains, for use in G-protein coupled receptor ligand binding assays. The polypeptide fragments retain biological activity such as binding a GPR ligand or modulating GPR ligand binding to a GPR (See W02747-W02999 for examples of polypeptide fragments). The polypeptide fragments can be used in compositions for treating subjects suffering from a pathology related to a GPR abnormality e.g. a psychotic disorder such as schizophrenia.
                                                                                                                                                                                                                                                                                                                                                ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   caenorhabditis elegans - useful in assaying substances to determine effects on cell growth, and in inhibiting nematode and insect pests Claim 13; Page 49-51; 79pp; Bnglish.

This sequence is presented as a potassium channel sequence encoded by the CORK gene from Caenorhabditis elegans. An alternative sequence is given in R92115. The protein may be expressed in a heterologous host cell to assay substances to determine effects on cell growth. Potassium-agonists or potassium-antagonists identified by this method
                                                                                                                                                                                                                                                                                                                                                                                   64 EEAEPHTEPEEQVPVEAEPQNIEDEAKEQIQSLLHEMVHAEHVEGEDLQQEDGPTGEPQQ 123

R70491-93 are polypeptides having a whole or partial epitope of a structural protein of Leucocytozoan protozoa encoded by 087587-89. The polypeptides and DNA encoding them are useful in the production of vaccines for the treatment of leucocytozoanosis of fowl. Sequence 195 AA;
                                                                                                                                                                                                                                                                                     Leucocytozoan protozoa structural protein epitope.

                                                                                                                                                                                  à
                                                                                                                                               therapy of malaria.

Disclosure; Fig 8: 108pp; English.

The malarial GLURP antigen is isolated from a genomic library and affinity purified using antibodies from malaria-immune patients. The antigen, and Abs raised therefrom may be used in diagnosis, immunisation and treatment of the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence is that of the polypeptide encoded by a region isolated from S. pneumoniae. The protein, or agonists of it, may be useful as an antibacterial for treatment or prevention of infection, specifically caused by S. pneumoniae (particularly meningitis) but possibly also Helicobacter (particularly meningitis) but possibly also Helicobacter (pylori (ulcers and gastric cancer). It may be of particular use before insertion of an in-dwelling device or any other invasive procedure. The protein, or nucleic acid encoding it, can also be used in vaccines to induce a cellular and/or humoral immune response, or to screen for other antibacterials. The DNA may also contain flanking sequences that are potential sources of control elements for bacterial can be used diagnostically, e.g. to detect a mutation for serotyping or classifying infectious agents.

The polypeptides of the invention contain at least one sequence having at least one epitope characteristic of a protein present on the surface of red blood cells (RBC) infected with Plasmodium falciparum (P.f.). They are useful as immunogens in protective vaccines against malaria, and for in vitro immuno-detection of P.f. in tissues or biological fluids. Nucleic acid sequences encoding the polypeptides are also claimed, and so are nucleotide probes contg. all or part of the nucleic acid sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ù

Claim 1: Fig 1: 118pp; English.

The present sequence represents the BOP1 protein encoded by the BOP1 cDNA isolated from the mouse corticotroph pituitary tumour cell line Afr-20 cDNA library. The BOP1 protein displays a tumour suppressing activity when it was constitutively and inducibly expressed in tumour cells. The BOP1 cDNA and the protein it encodes are claimed to be useful in the preparation of therapeutic compositions, useful for treating, preventing or delaying the recurrence of a tumour or neuronal disorders, e.g. genetic diseases or acquired degenerative encephalopathies such as Alzheimer's diseases. The BOP1 protein is also claimed to be able to induce apoptosis

The BOP1 protein is also claimed to be able to suppress tumour
                                                                                                                                                                                                                                                                                                                                                          resulting in inhibition of tumour cell growth, to suppress tumour formation, to induce G1 arrest of the cell cycle and to act as nuclear transcription factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated tumour suppressor gene - useful for developing products for use in diagnosis and treatment of tumour(s) or neuronal
                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

This sequence corresponds to a Plasmodium falciparum strain KI pre-erythrocytic liver stage antigen-3 (LSA-3) protein. The encoding pre-erythrocytic liver stage antigen-3 (LSA-3) protein. The encoding gene sequence was isolated by screening a P. falciparum strain T9/96 library with serum from a missionary treated by prophylaxis (for strain T6/96 see FR9101286). Of 20 clones isolated, clone 7295 was used to screen a library generated from Thai strain KI. One clone contained a 6.85 kb insert including the genomic sequence T78867. The gene comprises a 1.8 kb region encoding 3 major blocks of tetrapeptide repeats a 1.8 kb region encoding 3 major blocks of tetrapeptide repeats and a 3' hydrophobic region corresponding to a glycosyl-phosphatidyl-inositol membrane anchoring sequence. The invention relates to new polypeptides of at least 10 amino acids derived from the LSA-3 protein with the exception of the peptides W24791-4. The LSA-3 peptides can be used to raise antibodies and as vaccines for immunotherapy of malaria. Sequence 1786 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure; Fig 2; 62pp; English.
The inventors claim a DNA SQ which comprises a nucleotide sequence corresp to all or part of Plasmodium falciparum RNA. Also claimed is a synthetic peptide or polypeptide displaying the antigenicity of all or part of a P.falciparum antigen. The base sequence of clone Api6 (see W4072) indicates that the antigen coded for by this partial polynucleotide sequence has a homologous repeat structure of 11 AAs tandemly repeated 23 times.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         46 KVLLGLKERSTSEPAVPPEEAEPHTEPEEQVPVEAEPQ-NIEDEAKEQIQSLLHEMVHAE 104

Patent No. 5733772
GENERAL INFORMATION:
APPLICANT: Williamson, Kim C.
APPLICANT: Kaslow, David C.
TITLE OF INVENTION: Cloning and Expression of Plasmodium
TITLE OF INVENTION: faliciparum Transmission-Blocking Target Antigen, Pfs230
NUMBER OF SEQUENCES: 4
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                        2862 DMEEDDDQKAVKD-ELQDGAGDDDLEDLEEAEEPDLEEDDDQKAVKDELQDGAGDD-DD 2919

##label WA3

This enzyme uses ferrous iron as a cofactor, and while
beta-hydroxylating the peptidyl-aspartate substrate converts
alpha-ketoglutarate to succinate and releases carbon dioxide.

Aspartic acid and asparagine residues in the EGF homology domain of
substrate.
                                                                                                                                                                                                                                Jia, S.; VanDusen, W.J.; Diehl, R.E.; Kohl, N.E.; Dixon, R.A.; Elliston, K.O.; Stern, A.M.; Friedman, P.A.

Brain Res. Mol. Brain Res. (1995) 29:43-52
The single lamprey neurofilament subunit (NF-180) lacks
multiphosphorylation repeats and is expressed selectively
in projection neurons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A.; MacWilliams,

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

scale 0.386

Mean 47.881; Variance 124.175;

Statistics:

Mean 45.657; Variance 141.896; scale 0.322 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
